Abstract

With the urban transformation and economic construction work has achieved greater results. The contradiction between economic and ecological environment management work is deepening, based on the popularization of the concept of green sustainable development, it is necessary to effectively improve ecological environment problems and promote the economic process with ecological environment development. Based on ecological environmental protection, green water and green mountains construction, environmental protection and other needs, China has always adhered to the theory of historical materialism, effectively implement the construction of ecological civilization work, the application of Marxist ecological philosophy, research and development to improve the relevant policies on the promotion of ecological civilization construction in China, the establishment of a sound theoretical framework of China's ecological civilization policy. This paper analyzes the philosophical implications of the thought of ecological civilization in the new era and its important significance.

Keywords

Ecological civilization thought, philosophical implications, significance

1. Introduction

In order to protect a good ecological environment and avoid the old way of "pollute first, treat later" in developed countries. In order to promote economic development, we should implement ecological and environmental management at the same time. The construction of ecological civilization in the new era is to combine Marxist ecological philosophy with China's specific ecological environment, adhere to the road of sustainable development, respect the laws of nature, adhere to the harmonious coexistence of man and nature, let every individual in society participate in the construction of ecological civilization, and adhere to the strategy of sustainable development.

2. The scientific connotation of the thought of ecological civilization in the new era

2.1 The Basis is the View of Nature That Man and Nature are Unified

In the new era of ecological civilization thought, the unity of opposites between man and nature is upheld. Man depends on nature for his existence, and his survival and production activities are to a certain extent constrained by natural conditions, while man can change nature through his own subjective initiative. To sum up, in Marxist ecological philosophy, the relationship between human beings and nature is a philosophical relationship of opposition and unity, and the two are interdependent and cannot be separated. Therefore, human beings need to use natural

resources, carry out production activities, etc., based on reasonable premises, develop and utilize natural resources, and avoid rough resource development and utilization; otherwise, it will cause such evil consequences as resource depletion and restrict social progress and development. When seeking economic development, it is necessary to effectively implement the practical work of ecological civilization construction, advocate green development, resource conservation, environmental protection and other development principles, so as to build a new pattern of ecological development in which man and nature coexist harmoniously (Ma Qiangqiang, 2018).

2.2 Establish the Green Development Concept of Green Water and Green Mountain is the Silver Mountain of Gold

In the new era of ecological civilization concept, emphasis is placed on establishing and practicing the core of the idea that green water and green mountains are the silver mountains of gold. This concept of development is a scientific theory based on the Marxist philosophical theory and the extensive practice of our country in the work of ecological civilization governance. This theory reveals the core requirements of modern ecological civilization construction work, provides theoretical guidance for modern ecological civilization development and harmonious society construction work, and to a certain extent breaks the opposition between economic development and environmental protection, making economic development and environmental protection work present a strong homogeneity. Strengthening the construction of ecological civilization makes people and nature develop harmoniously, implements the development concept of the new era, emphasizes green development and low-carbon development, promotes healthy and scientific production and living concepts, and further promotes the sustainable development of social economy. Secondly, the development concept that green water and green mountains are golden mountains also reveals that promoting the effective comprehensive utilization of resources is also to promote social economy. The development of renewable resources is a long-term and must always adhere to the ecological strategic policy, but also a major social science information technology and socio-economic development policy, for the continuous improvement of the comprehensive utilization efficiency of resources, the development of renewable resource economy, the construction of renewable resource-saving economy and society, to promote the construction of ecological civilization has a very important historical and practical significance (Yu Shuang, 2019).

2.3 Adhere to the View That a Good Ecological Environment is the Livelihood of the People's Well-being

The new era of ecological civilization concept points out that a good ecological environment is the most affordable welfare of the broadest number of people, green mountains and water is ecological protection, is a good environment, is happiness. The establishment of a sound green system and policy will have an incentive effect on ecological and environmental governance and provide basic protection for the people's good living environment. Ecological environment management and protection can effectively improve the neatness of the living environment, improve the pollution problem and enhance the happiness of the residents. At the same time, the improvement of the living environment can provide good preconditions for the development of the economy and culture of the relevant areas, so as to achieve the coordinated development of economy and environment, thereby enhancing the comprehensive strength of the area and the happiness of people's life. Therefore, we must resolutely win the battle of environmental pollution prevention and control, guard the blue sky, optimize the environment, and defend people's happiness (Liu Hongyu, 2017).

2.4 Grasp the Systemic View of Integrated Mountain, Water, Forest, Field, Lake and Grass System Management

The new era of ecological civilization concept emphasizes that the ecological environment is a unified whole of various elements, and we should adhere to the common management and development of all elements of the mountain, water, forest, field, lake and grass. To promote the ecological environment management work, it is necessary to strengthen the comprehensive management, strengthen the reasonable protection of natural ecology and strengthen the construction of long-term system mechanism for disaster prevention and mitigation. Adhere to the nature protection ecological resources and environment priority and natural environment rehabilitation of the organic combination of ecological development management, in order to fundamentally reverse the development trend of continuous serious deterioration of the ecological environment. At the same time, we should implement the basic work such as mountain forest restoration and construction and ecological protection work of natural forest

ecology, forest land retreat and forest planting, forest retreat and forest planting and forest weeding, forest retreat and forest planting, laying a good foundation for the comprehensive management of desertification and stone desertification in mountains and forests, protecting the wetlands of desert grasslands and forest swamps. Accelerate the establishment of a long-term mechanism to improve the policy of ecological protection compensation, strengthen the management of ecological protection and utilization of key regional ecological protection function areas, enhance the governance ability of the area to contain local water, maintain local soil and water, prevent wind and sand, enhance the ability of ecosystem self-recovery, achieve ecological balance, give full play to ecological functions, and build a good ecological system (Wu Linghui, 2019).

2.5 A Win-win Global View of Building a Beautiful World

The new era of ecological civilization emphasizes that the earth is the environment on which human beings depend for survival, and in the process of globalization, the problem of deteriorating ecosystems makes it impossible for people of all countries to stay away from it. All countries should unite to build a community of human destiny based on the height of human social development, jointly seek the path of global ecological civilization, adhere to the concept of sustainable development, and promote the development of a modern ecological civilization system. The deteriorating living environment of human beings has caused a great impact on the sustainable development of society, and the issue of ecological and environmental governance needs to be properly dealt with. Countries must accelerate industrial transformation, upgrading and development, supported by green industries, gradually change from brown industries with high pollution, high emissions and high consumption to green industries with low carbon, environmental protection and energy saving, actively develop new technologies to promote green industries, promote green production methods and achieve green development (Zhao Zhisheng, 2016).

3. The Philosophical Implications of Ecological Civilization Thought

3.1 The Core of the Idea is the Ecology of the Subject

In the context of the broken ecological environment, which threatens human development as well as social progress, it is necessary to grasp the main contradiction and place the ideas of ecological environmental management as well as ecological environmental protection at the core of production and life, which is a requirement in the Marxist philosophical view of development. In Marxist philosophy, things exist objectively, and what exists in nature must have its own meaning of existence. Human beings as subjects in nature must play a subjective initiative to deal with the problem of environmental damage. For ecological environment management as well as protection work, it is necessary to adhere to the ecological view of the subject, emphasizing the play of human subjective initiative, and take appropriate and correct measures to improve the ecological environment. The main ecological view is actually a combination of Marxist ecological view and practical view, reflecting the spirit of humanism. The integration of the two emphasizes the harmonious symbiosis between man and nature, which also alleviates the contradiction between man and nature in opposition to each other. Under the premise that the laws of nature cannot be changed, man should follow the laws of nature and practice the concept of green development and lifestyle.

3.2 The Perspective of Thinking is Dialectical Ecology

With the continuous promotion of ecological civilization construction work and ecological environment improvement work, objective ecological problems at the present stage have come one after another. Therefore, when carrying out ecological civilization construction work, it is necessary to grasp the inner laws of things, summarize the phenomena that appear in ecological governance work, comprehend the essential requirements of ecological development, and form a basic methodology to better promote ecological civilization construction. To solve ecological problems, we need to grasp the Marxist ecological philosophical outlook, combine the current ecological construction work, and look at ecological problems dialectically with scientific materialist thought. The thought of ecological civilization in the new era has enriched and developed Marxist philosophical thought, while the materialistic dialectic in Marxist philosophy is the core of ecological civilization thought, and the two complement each other to further promote the development of contemporary ecological civilization. In the issue of economic development and ecological environmental protection, we should adhere to dialectical thinking, effectively consider the economic benefits of ecological and environmental management work, combine the characteristics of natural and human resources in different regions, use low-cost ecological technology and modern science and technology to promote economic green development, adhere to the principle of sustainable development, do a good job of eco-

logical protection, and avoid the development of drying up and fishing, killing the chicken to get the eggs. To formulate a fiscal policy incentive system for the rational conservation of resources and the promotion of environmental resource protection, and to study and improve the system for promoting energy use. Rational conservation of resources and promotion of environmental resource protection is the use of effective economic policies to promote ecological and environmental protection work, applying the idea of dialectical ecology to achieve the protection and development of ecological resources and economic benefits, making economic development needs and ecological and environmental management work to promote each other (Wu, X., 2020).

3.3 The End Result is a Harmonious Ecology

The ultimate goal of Marxist philosophical ecology is to promote the all-round development of human beings and ultimately achieve the harmonious coexistence between human beings and nature, so as to provide a good environment for human beings to give full play to their abilities. The new era of ecological thought emphasizes the development of human initiative, following the laws of natural development, and living in harmony with nature, therefore, the transformation of nature by man must be a beneficial transformation, so its ultimate goal is to achieve "harmonious ecology". Based on the harmonious ecological orientation, it is necessary to improve the system of population management, social security, urban development management and other systems that reflect social progress. In the development process of rural society, to build a harmonious society with a pleasant environment, we should focus on solving ecological relationship tensions, resolving conflicts and eliminating unstable factors. Secondly, it is necessary to establish a sound carbon emission trading system, ecological compensation system and other systems that are beneficial to the ecological environment, a sound green taxation system, a green procurement system and a green development performance assessment system. At the same time, green fiscal policy, green financial policy, green industry policy, etc. will be formulated. These systems and policies will guide and motivate people in all regions to carry out green production and consumption and vigorously promote the development of ecological civilization.

4. The Path to Promote the Construction of Ecological Civilization in the New Era

4.1 Develop and Improve the Ecological and Environmental Legal System

In order to further implement the enforcement of ecological environmental protection, first of all, it is necessary to develop and improve the legal system of ecological environment and clarify the objectives of ecological environmental protection enforcement. Since the project of ecological environmental protection is huge and includes the authority and responsibility of many departments, it requires coordination and cooperation among all units and departments. In order to promote better collaboration between different departments and to promote more efficient ecological environmental protection work, it is necessary to establish a unified management organization, to clarify the authority and responsibility of each department, to better implement ecological environmental protection law enforcement work, and to avoid the phenomenon of shifting responsibilities. In order to further implement the enforcement of ecological environmental protection, first of all, it is necessary to develop and improve the legal system of ecological environment and clarify the objectives of ecological environmental protection enforcement. Since the project of ecological environmental protection is huge and includes the authority and responsibility of many departments, it requires coordination and cooperation among all units and departments. In order to promote better collaboration between different departments and to promote more efficient ecological environmental protection work, it is necessary to establish a unified management organization, to clarify the authority and responsibility of each department, to better implement ecological environmental protection law enforcement work, and to avoid the phenomenon of shifting responsibilities.

4.2 Construction of a Common Governance Model with Multiple Subjects

The relevant environmental protection departments to implement the layout of ecological civilization construction work by building ecological civilization construction management organization structure, so as to build a multi-body model of shared governance. First, setting up a comprehensive ecological civilization construction management office to coordinate the ecological civilization construction management work. Regularly carry out ecological civilization construction inspection work, and the implementation of ecological civilization construction management work, to discuss and make decisions on practical issues, and put forward a comprehensive scientific management advice. Secondly, the main ecological management and daily management work is undertaken by so-

cial entities, and the ecological civilization construction work is optimized through the implementation of the management responsibility system and the establishment of management personnel. In the work of ecological environment improvement, it is necessary to emphasize the exploration of paths and the quality of improvement, to carry out comprehensive ecological civilization construction work, to promote the development of the whole area improvement work, to promote ecological civilization construction, and to realize the transformation of ecological governance and environmental protection work from speed expansion to quality improvement. It further improves the ecological governance mechanism, gathers the problems arising in the process of ecological civilization construction, promotes the development of ecological civilization, carries out the construction of modern industrial system, production system and management system, promotes theoretical and policy research on ecological construction, management structure and social governance, basic public services, social welfare and people's livelihood, and provides theoretical support and decision-making consultation for the implementation of ecological civilization strategy. Finally, an innovative ecological civilization construction management assessment and supervision system needs to be established to clarify the management responsibilities of those in charge of relevant subjects. Ecological civilization construction management will be included in the scope of the title assessment, so that the person in charge of the subject can take the initiative to undertake the management content. Based on this basis, an inspection and supervision mechanism should be set up to regularly inspect and check the ecological management work, so that problems in ecological management can be found in a timely manner and relevant responsible parties can be ordered to correct them in order to improve the ecological civilization construction work (Yu Xiuling, 2019).

5. Conclusion

This paper focuses on the idea of ecological civilization and its philosophical meaning. Building ecological civilization is a long-term and arduous social development task, and all departments should seize the opportunity to implement good ecological civilization construction work based on the actual situation of the city. In the work of ecological civilization construction, it is necessary to balance economic and environmental protection work, and to realize ecological civilization construction through measures such as promoting ecological civilization construction based on development needs and strengthening the application of Internet technology. The use of modern science and technology development to form green industries, construction of green infrastructure, etc., and the establishment of sound ecological protection policy, improve the people's awareness of environmental protection, to effectively create a good production and living environment. Promote the rational development and utilization of pristine ecological resources, promote the sustainable development of the economy, and thus effectively promote the development process of modern society.
